EDUCATION

Stony Brook University — ***Stony Brook, NY***
B.S. in Computer Science, Specialization in Artificial Intelligence & Data Science — *Graduated: May 2026*
Awards**:** Dean's List (6 semesters), Far Beyond & Grumman Engineering Scholarships — GPA: 3.6/4.0

TECHNICAL SKILLS

Languages*: Python, TypeScript, Java, JavaScript, SQL, Go*
Backend & Data: *REST APIs, Microservices, Distributed Systems, Data Pipelines, PostgreSQL, Redis, Supabase, WebSockets*
AI/LLM: *Claude Code, Agentic AI, RAG, Retrieval/Extraction Pipelines, LLM Evaluation, Pinecone, Cohere*
Cloud & DevOps: *AWS (EC2, RDS, S3), Docker, Terraform, GitHub Actions CI/CD, Vercel, Linux, Git*

PROFESSIONAL EXPERIENCE

MetroPrint USA — New York, NY
Contract Full-Stack Engineer — *July 2026 - September 2026*

- Used Claude Code and AI-assisted development to translate a print-shop owner's workflows into a production Next.js/TypeScript platform supporting ~97 configurable products.
- Automated ingestion of 80 products and 559 pricing rows into Supabase, translating client data and reconciling counts.
- Rebuilt pricing around 559 exact-combination rows, blocking invalid configurations and client/server checkout-total drift.

Pencil Learning Technologies — San Francisco, CA
Software Engineer Intern — *June 2025 - August 2025*

- Built core sync infrastructure for the Mario SDK (published TypeScript package), cutting state-update latency from ~500ms to <100ms with incremental JSON Patch diffs
- Designed conflict-free merge logic with Yjs CRDTs preventing lost updates and maintaining consistent state on reconnect.
- Integrated the SDK into 10+ embedded apps, cutting cross-client state drift by 30% and removing 1K lines of per-app glue
- Automated CI/CD with GitHub Actions and Docker (typed build, test, npm publish), trimming release cycle time by 15%

Vertically Integrated Program, Stony Brook University — Stony Brook, NY
Software Engineer Intern — *August 2024 - December 2024*

- Shipped 15+ Node.js/Express REST endpoints on AWS (EC2, RDS), adding Redis caching and composite PostgreSQL indexes to cut p95 response time ~20%
- Added validation, pagination, and query batching to list APIs, eliminating N+1 queries and unbounded-response timeouts
- Built Jest + Cypress suites into a GitHub Actions CI gate, raising backend coverage ~50%→~90% and cutting manual QA ~30%

99 YARDS — New York, NY
Software Engineer Intern — *June 2024 - August 2024*

- Built a TensorFlow two-tower recommender behind Node.js APIs, lifting offline hit-rate@10 ~25% over a popularity baseline
- Built PostgreSQL pipelines for training and online scoring, cutting feature-freshness lag from 1h to 5min with incremental updates

Teaching Assistant | Java and Data Structures — *August 2024 - May 2025*

- Led weekly recitations for 30+ students and reviewed 200+ data-structures submissions, coaching debugging and Big-O trade-offs.

PROJECTS & ADDITIONAL EXPERIENCE

AlphaBrief | Independent Project **https://secfrontend.vercel.app/** — April 2026 - Present

RAG research tool over SEC 10-K filings; answers natural-language questions with citation-backed, multi-year company analysis.

- Built a **Python** hybrid retriever (**Pinecone** dense + BM25, rank fusion, Cohere rerank): 0.88 MRR, 0.70 Recall@10, 0.62 Precision@5 on a 125-question benchmark
- Built a resumable Python SEC EDGAR ingestion pipeline processing 4,262 Pinecone chunks with index-parity checks and 320 tests
- Added **FastAPI** ticker/year scope filtering before generation: full comparison coverage, zero cross-company/year leakage
- Cut answer-generation latency ~74% (median 7.6s → 2.0s; end-to-end p95 19.5s → 5.4s) via output-token bounds

Distributed Systems Platform | Independent Project — *September 2025 - December 2025*

- Built a distributed Go chat system across 3 Fiber instances, supporting 100 WebSocket connections/room with Redis pub/sub and buffering up to 10,000 messages/sec through Kafka.
- Deployed the Dockerized stack to AWS (EC2, S3) with Terraform and GitHub Actions CI/CD behind a TLS-terminated Nginx proxy.
